Thank You!Q: Windows 7 - How to find out what's installed in windows 8? I have a developer friend who has Windows 7 on his desktop. He wants to know how to move all his software/data to his new Windows 8 laptop. I'm able to export his data (including his personal files) to his new Windows 8 laptop. I'm trying to understand which applications are installed in Windows 8. From my research on the internet, it seems that there are 2 methods to do this - Method 1: Install Windows 8 on a second partition on the hard disk (Which I don't want to do) Convert the hard drive to a native format (i.e. NTFS) Wipe the drive clean Install Windows 8 on the new partition Method 2: Have a virtual machine installed Install Windows 8 on the VM Copy all the data to the new Windows 8 installation Have both Windows 8 & Windows 7 running on the same computer Does anybody know which of the methods above is the most recommended way to move all the software/data from one machine to another? A: It is a good idea to convert your hard drive to NTFS but installing Windows 8 on a secondary partition is a bad idea. You will lose any programs installed to the windows 8 drive. You could try converting to NTFS and putting it in a virtual machine and then transfer all your data over and then convert the hard drive to NTFS to use on the dual boot. Note that if you convert the hard drive it will be read-only. If you are looking to move everything from Windows 7 to Windows 8 then you should look into the VPC feature of Windows 8. I think I saw a blog post on it somewhere. Q 82157476af
